

DICK SMITH VZ200

Personal
Colour Computer

First Book of Programs

B-7202

**DICK SMITH'S
FIRST BOOK OF PROGRAMS
FOR THE VZ200**

FOREWORD FROM DICK SMITH

Incredible! I just can't seem to keep up with the way these computers continue to get not only smaller, but also more intelligent. With the release of our amazing new VZ-200 computer, we have continued our commitment to making available what we believe are some of the most exciting advances in computer technology to be seen in years.

Who would have imagined just a few short years ago that we would be able to produce a machine like the VZ-200 with features such as colour, graphics, sound and BASIC from the well respected American firm, Microsoft. Add to that outputs for either T.V. or monitor, provision for cassette storage, memory expansion and a printer interface. Take all this, pack it into a small, neat package and sell it for an unbelievably low price of just \$199.00. Whoever would have believed it!

In brief, this then is the amazing VZ-200 and as far as value for money is concerned, I believe that it will be very hard to beat.

The VZ-200 is primarily aimed at the person who wants to 'get into' computing and learn 'what it's all about' without having the normal hassles associated with larger, more expensive machines.

Regardless of whether you are young or classed as an 'oldie' (by others that is), you will benefit from the many facets of learning that can be enjoyed using your VZ-200. You will quickly appreciate the diversity of capability and you will find that as you learn one facet of the VZ-200, it will lead you into another, each time increasing your own ability. You may for example be interested in producing colourful graphics designs, simple music or like to simply 'muck about' with programming. It doesn't really matter, so long as you have fun doing it.

To enable us therefore to give you a really good introduction, and to assist by taking some of the mystery out of computer programming, we have produced this book of programs to help show you 'how it's done'. Some are entertaining and some are educational. We hope you enjoy the programs presented herein and while you are learning about your new computer, remember to have fun!

Dick Smith

Crazy Story

As the first program in our book for the VZ-200, we decided it would be a good idea to get you laughing. We certainly hope that it does!

This program jumbles up parts of a series of 10 stories with crazy results. The stories are then displayed on your screen and if you have a printer attached to your computer, you can choose to print the story out on paper and even produce your own book!

FOR THE PROGRAMMER

As this book has been written with the intention of helping you to learn more about the programming side of your VZ-200, we will present in this segment for each program, information relating to 'how it's done' in the program.

It is also important to note that where the little pointer  is used in the margin of a program line, it means that the information needed to determine how we achieved the particular graphics code used in that program line can be found at the end of each program. This mainly relates to the use of inverse or graphics characters fed in directly from the keyboard.

In this first program, note the routine used at lines 20040-20070 which creates the MARQUEE effect.

Word Race

This program is an exciting race against the clock to sort a list of six words into alphabetical order. The faster you do it, the higher your score. The computer will keep track of the name and score of the player with the highest score. Good luck!

FOR THE PROGRAMMER

In order to determine which keys are being pressed we use the PEEK command to examine location 28416 (line 103). The value stored in this location will determine which key has been pressed.

If you have the 16K memory expansion module fitted, it would be a good idea to add more words to the program. To do this simply add extra DATA lines and alter (by increasing) the value of NW in line 90. You may also have to increase the amount of space CLEARed for strings in line 60.

What's My Number

Using this program, the VZ-200 will think of a number and your job is to try and guess what the number is. The computer will then inform as to whether your guess is "TOO HIGH" or "TOO LOW". You will also be given the opportunity set the upper limit for the number to be guessed. How many tries will YOU take to get it right?

FOR THE PROGRAMMER

This type of program is an excellent 'learning' program for the beginner and is the type of program that you can write for yourself. The program has deliberately been kept simple and we would encourage you to improve the program.

Note how line 3065 checks to see if the computer should print "GUESS" or "GUESSES".

What's My Letter

If you think that this program is very similar to the preceding one, you're quite correct. The difference here is that this time you have to guess a letter from the alphabet rather than a letter.

FOR THE PROGRAMMER

This is a good example of how to 'adapt' an existing program rather than starting completely from scratch to produce a 'new' version of the program. We suggest that you compare the previous program in order to determine where the changes have been made and see how easily this program has been adapted.

VZ-200 Maths Quiz

This program lets you practice your maths skills. You are given a choice of addition, subtraction, multiplication, division or a mixture of these at any of three levels of difficulty. When you decide to quit, you will be presented with a complete report. By the way, your VZ-200 makes random comments after each effort. It can in fact be quite rude!

FOR THE PROGRAMMER

Note the interesting method used in line 160 to select the required choice from the menu. Note also how each section of the program is separated by REM statements from line 1000 to allow you easy access to follow the logic.

VZ-200 Music Box

In this program, your VZ-200 indulges in a little nationalistic nostalgia. It will with great dexterity and skill, play 4 of Australia's best known tunes:

The Pub With No Beer

Advance Australia Fair

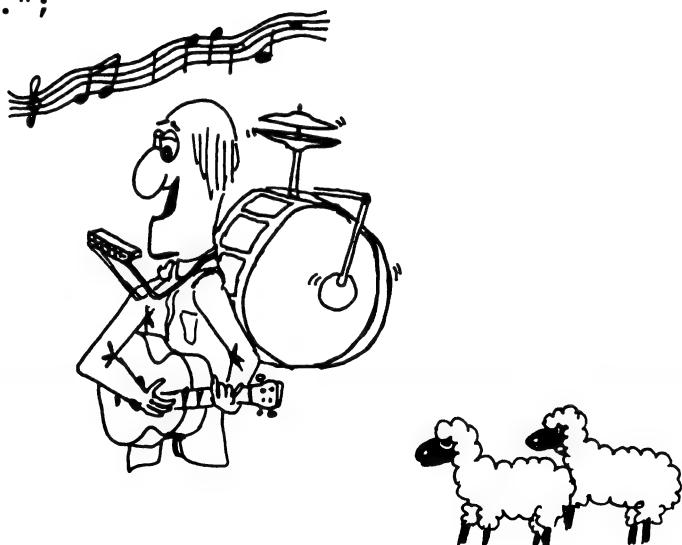

Botany Bay

Tie Me Kangaroo Down.

FOR THE PROGRAMMER

Because this program 'plays' four different tunes, each of the required sets of DATA statements has been separated and is treated individually once selected from the menu. This has been done to allow you to see how each tune has been derived. Note the DIM statements in lines 100-130 which sets the size (number) of DATA statements used for each tune. Note also the simple way in which each tune is played by using a FOR...NEXT loop such as in lines 1010-1070.

VZ-200 Clock

This program turns your VZ-200 into a digital timepiece. In order to maintain the accuracy of the program, we suggest that you key in the program EXACTLY as it is - spaces, REM's and all!

FOR THE PROGRAMMER

The loop in line 3030 is used simply to act as a delay to adjust the clock's timekeeping accuracy. Adjustment of the period of delay can be made by altering the value (by either increasing or decreasing the value) of TW in line 80. Another method used to 'slow things' down would be to add REM statements between lines 3010 and 3060. You'd be surprised to learn just how much time they can take up in a program.

Note also the testing done from line 7000 to ensure that the time figures that have been entered, are valid.

What Day Of The Week Is It

This neat little program will calculate which day of the week it is (or will be) for virtually any date within this century. What day of the week were you born on?

It is very important to ensure that the date is entered correctly, i.e. DD/MM/YY. (e.g. 12/08/47 for 12th August, 1947). To reiterate, two digits are required for each section of the date.

FOR THE PROGRAMMER

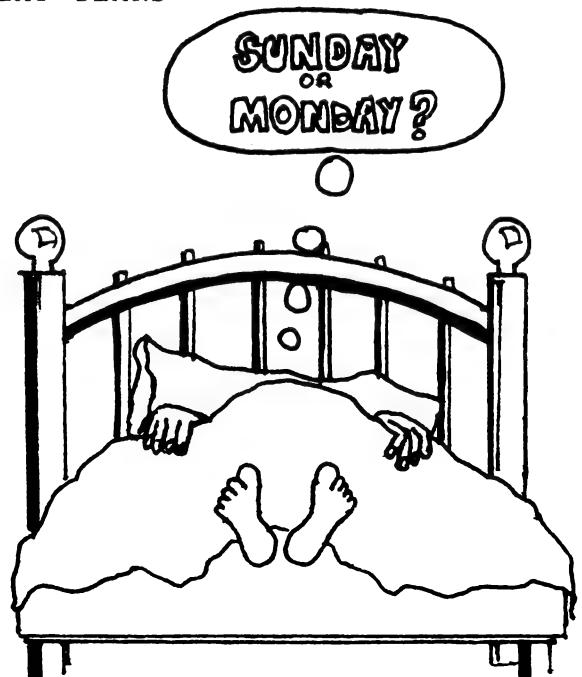

Note the manipulation of string data (the date in this case) in lines 1160-1260 used to extract the day, month and year from the INPUTed string DD/MM/YY using the string functions LEFT\$, RIGHT\$, MID\$ and VAL.

```

Crystal Spectacular

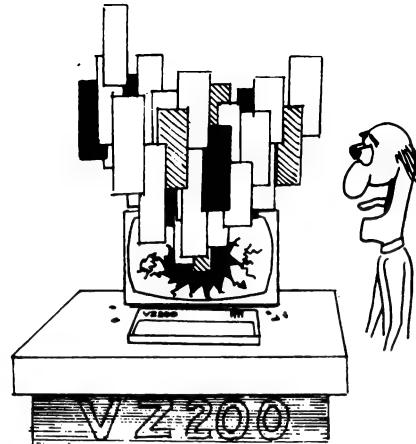

Here, we have allowed the VZ-200 to show its artistic side in this stunningly beautiful program. Random rectangular patterns are drawn all over the screen producing a brilliant colour display. At any time, you can freeze the display by simply holding the SPACE key until you hear a low buzz. You may continue the program simply by hitting the RETURN key. With this program running, you are guaranteed to impress your wife, kids and friends and (at last) justify your purchase of the VZ-200.

FOR THE PROGRAMMER

In this program, High-resolution graphics is used by switching display mode at line 60. Line 300 randomly chooses the new locations (X and Y) and size (LT) of the next 'crystal'.

Line 310 checks to see if the SPACE key is being held down. If it is, the program moves to the routine beginning at line 400 where it is held at the INKEY\$ in line 410 until it detects a RETURN key (ASCII 13).

Write A Story

This program creates absolutely hilarious stories! There are two stories in memory with a number of words left out. The computer will ask you to put in the missing words and the computer will then print the story for you.

If you have a printer attached the program can produce a copy of the story for you on paper.

One of the stories predicts the future for you and your friends while the other extols the virtues of "Good Health"!

To help you in answering the questions, here is a quick cram in English grammar:-

An ADJECTIVE describes something or somebody, e.g. lumpy, ticklish, blonde, messy etc.

A NOUN is the name of a person, place or thing, e.g. woman, footpath, dog, book, umbrella etc.

A PLURAL NOUN is a noun naming more than one person, e.g. women, yards etc.

An EXCLAMATION is any sort of odd sound or outcry, e.g. gasp, ouch, wow, gadzooks etc.

N.B. Try to think of unusual and/or funny words to use. Don't make them too long or they won't fit the screen properly. If you want a real good laugh, this is it!

FOR THE PROGRAMMER

Rather than using DATA statements as in previous programs to reproduce information, it was decided to use string functions and show you how they can be manipulated. The manipulation of string data is one of the many useful advantages that BASIC has to offer. No other language allows the freedom (of BASIC) in this one respect.

As this program does a fair bit of 'jumping around' within itself, we suggest that you take a particular choice from the menu, and using a separate pad and pencil, write down the 'flow' of the program by following the logic as it goes both up and down within the program.

```

VZ-200 Hangman

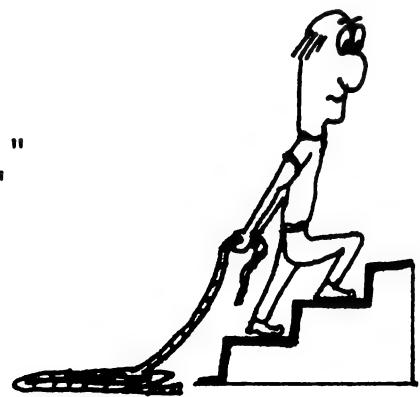

This program is the VZ-200 version of the traditional game. The computer chooses a word from its memory and prints on the screen a dash for each character of the selected word. You then choose which letter you want and if correct the computer will place that letter in the correct position(s). If you are wrong, then you begin the process of being hung! Another feature of the game is the ability to enter your own word instead of one from the computer.

FOR THE PROGRAMMER

If you have the 16K Memory expansion, you might like to increase the number of stored words. To do this simply add DATA lines and alter the value of NW in line 70 to match the total number of words stored.

Line 2035 checks to ensure that the player's finger has released the key before proceeding. The memory location 28416 should contain 255 when no key is pressed.

Moving Targets

In this program you have to try to hit the moving targets. Each one hit scores 500 points, while each miss will cost you 100 points. A score of over 8,000 will give you bonus time. As the score gets higher, you will find that the targets become harder to hit.

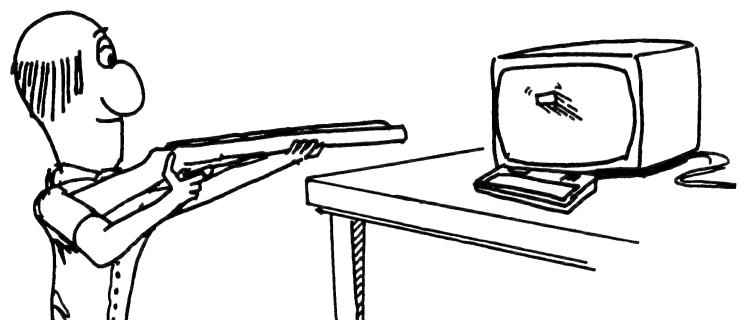

The computer will keep track of the name and score of the player with the highest score.

FOR THE PROGRAMMER

This program has been designed in a straightforward manner to allow you to follow the logic and see how the 'target' is moved in lines 5010-5040. Also the determination as to whether the target has been hit or not (line 6400- 6440) and progressive scoring in line 2010.

The logic used in this program can be 'tailored' to suit a variety of applications that require movement of an object, so examine the routines closely.

VZ-200 Mastermind

This is the computerised version of one of the world's most popular games, Mastermind. In this version, you are pitted against the amazing VZ-200 . . . Can you win?

The standard rules for Mastermind apply here. You have to choose from eight colours depicted along the top row of the keyboard. Simply touch the key below the required colour and it will be selected.

For each colour correctly selected and placed in the correct position, you will receive a black marker. A correct colour only (and in the wrong position) will result in a white marker being displayed. These are the only clues you will be given. You will have only eight turns to try to deduce the correct combination. Good luck!

N.B. If you have trouble differentiating between the colours on your TV screen, you may wish to replace line 1530 with the REM statement in line 40 (remember to remove the REM word itself). This will display the colour number next to each colour square.

FOR THE PROGRAMMER

As this program is a little more complex than most, we have again used REM statements throughout the program to explain what is happening in the various sections. Note the way in which the initial random code is generated in lines 200-280. Also, the continued used of string functions throughout this program.

Also note the 'guess' routine from lines 1000-1100 which incorporates the keyboard Peek address. It (the PEEK) is 'calling' the keyboard to check and 'see' whether or not a key has been pressed and if so, which key.

C SAVE "VZ-200 CUP"

VZ-200 Cup

This neat little program simulates a horse race. Up to ten people can place bets on any of the six horses. Each horse is given 'odds' and as a rule will race accordingly. However a long shot has been known to win!

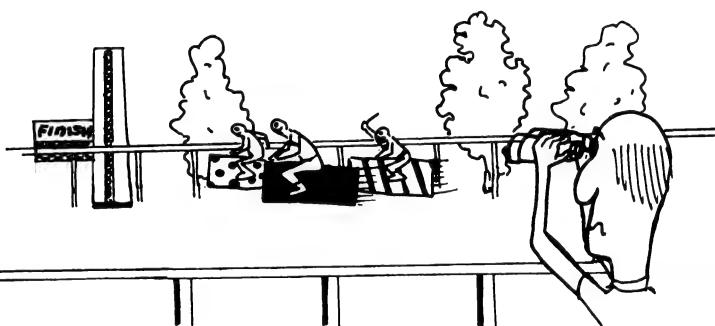

Imagine the joy of tearing your hair out as you watch the race in living colour. The computer will keep track of the bettors' names and winnings (if any!) and is one program that should keep you on the edge of your chair.

FOR THE PROGRAMMER

Lines 4000-4060 determine whether or not a particular horse will move on each round. Line 4010 lessens the chance of a horse with high odds while line 4007 gives that same horse an extra chance. Line 575 however, is one that can on occasions give a 'long-shot' horse a real winning chance.
